Buzzworthy: Practice Test 1

Time: 50 minutes. Partners rotate through 15 stations, 3 minutes each, and may not go back or skip ahead. You may use your 2 references (field guides or 1-inch binders), pencils, and up to 2 hand lenses. At each station, first write the class and/or order, then answer the other questions.

Partner names: _____ and _____ Score: _____

Station 1

1. Part 1: What class is it in?

2. How many legs and how many main body parts does it have?

3. Ticks are in the same class. Name one way to stay safe from ticks on a hike.

4. Warmer winters let more ticks survive. Why is that a health problem for people?

Station 2

5. Part 1: What class is it in?

6. How does it get its food?

7. A different animal is round and slow, has 2 pairs of legs on most segments, and curls into a spiral when touched. What class is it in, and what does it eat?

Station 3

8. Part 1: What class is it in?

---

9. How many pairs of antennae do animals in this class have?

---

10. How is this animal important to people in North Carolina?

Station 4

11. Part 1: What class and order is it in?

---

12. Its young is a white, C-shaped grub. What kind of metamorphosis is this? List the stages in order.

---

13. What kind of mouthparts does it have?

---

14. This beetle came from Asia. The adults eat leaves of roses and grapes, and the grubs eat grass roots. Is it helpful or harmful to people? Explain.

Station 5

15. Part 1: What class and order is it in?

16. Its caterpillar eats only milkweed, and poison from the milkweed stays in its body. How do the bright orange colors help the adult?

17. As it sips nectar, how does it help the flower?

18. Monarchs fly to Mexico every winter. Give one way climate change could harm them.

Station 6

19. Part 1: What class and order is it in?

20. Name 2 body clues that put it in this order.

21. Paper wasps hunt caterpillars to feed their young. How can this help a gardener?

22. They build paper nests from chewed wood. What type of mouthparts do they use?

Station 7

23. Part 1: What class and order is it in?

---

24. How does a house fly spread germs to people?

---

25. Its larvae (maggots) eat dead animals and waste. What is their job in the ecosystem?

---

26. Instead of back wings, it has 2 tiny knobs. What are they called, and what do they do?

Station 8

27. Part 1: What class and order is it in?

---

28. Farmers buy the eggs of this insect to put on their crops. Why?

---

29. Using helpful insects and other safe steps together to control pests is called IPM. What does IPM stand for?

---

30. Another insect in the garden is long, thin, and brown, and it looks exactly like a twig. What order is it in, and what is this adaptation called?

Station 9

31. Part 1: What class and order is it in?

32. The small white oval glued to the hair is its egg. What is a louse egg called?

33. The louse gets food from a person, and the person is harmed. What kind of relationship is this?

34. A tiny wingless insect, flat from side to side with big back legs, jumps off a cat. What order is it in? Name one disease it can spread.

Station 10

35. Part 1: What class and order is it in?

36. How does a male cricket make its chirping song?

37. What kind of metamorphosis does it have, and what is its young called?

38. People in many countries eat crickets, and pet stores sell them to feed lizards. Why are crickets good food?

Station 11

39. Part 1: What class and order is it in?

---

40. Its young live underground for years. What do they eat, and how?

---

41. Aphids are in this order too. Ants protect aphids and eat the sweet honeydew they make. What kind of relationship is this?

---

42. A red food dye is made from tiny scale insects in this order. Name one other useful product people get from insects.

Station 12

43. Part 1: What class and order is it in?

---

44. The one on the far right with the big dark head and jaws is a soldier. What is its job?

---

45. Termites help forests but harm houses. Explain both.

---

46. A different insect with pincers at the tip of its abdomen hides under wet mulch. What order is it in?

Station 13

47. Part 1: What class and order is it in?

48. Is it a dragonfly or a damselfly? What clue tells you?

49. Adults and young of this order are predators. How can they help people?

50. Dragonfly and damselfly young in the same pond hunt the same small animals. What is this relationship called?

Station 14

51. Part 1: What class and order is it in?

52. Where does this young insect live? What body parts along its sides help it breathe there?

53. The adults live only a day or two. Name 2 animals that eat lots of mayflies.

54. Another stream larva uses silk to glue tiny pebbles or sticks into a case to live in. What order is it in?

Station 15

55. Part 1: What class and order is it in?

---

56. It lives on rocks and tree bark. What does it eat?

---

57. A flat, silvery insect with 3 tail threads eats book glue and cereal inside houses. What order is it in? Is it a helper or a pest?

28	Its larvae eat aphids and other pests, so farmers need fewer chemical sprays.
29	Integrated pest management.
30	Phasmatodea (walking stick); camouflage.
Station 9	
31	Insecta, Psocodea (head louse).
32	A nit.
33	Parasitism (the louse is a parasite).
34	Siphonaptera (flea). Plague (or tapeworm).
Station 10	
35	Insecta, Orthoptera (field cricket).
36	He rubs his front wings together (a scraper on one wing rubs a file on the other).
37	Incomplete metamorphosis; the young is a nymph.
38	They are full of protein and other nutrients, and they are easy to raise.
Station 11	
39	Insecta, Hemiptera (cicada).
40	They suck sap from tree roots with a piercing-sucking beak.
41	Mutualism (both are helped).
42	Honey or beeswax (bees), silk (silkworm moths), or shellac (lac insects). Honey is also used on wounds as medicine.
Station 12	
43	Insecta, Blattodea (termites).
44	It guards the colony and fights enemies like ants.
45	Forests: they break down dead wood and return nutrients to the soil. Houses: they eat wooden boards and beams, which costs people money to fix.
46	Dermaptera (earwig).
Station 13	
47	Insecta, Odonata (ebony jewelwing damselfly).
48	A damselfly. It rests with its wings closed over its back (a dragonfly rests with wings open flat).
49	They eat mosquitoes and other biting insects (the young eat mosquito larvae in the water).
50	Competition.
Station 14	
51	Insecta, Ephemeroptera (mayfly nymph).
52	Underwater in streams and ponds; gills.
53	Fish (like trout), birds, bats, frogs, or dragonflies (any 2).
54	Trichoptera (caddisfly).
Station 15	
55	Insecta, Archaeognatha (jumping bristletail).
56	Algae, lichens, moss, and bits of dead plants.
57	Zygentoma (silverfish). A nuisance pest in homes.
